Acute-onset tremors

Tremors alone

Results of blood tests normal

- Primary neurologic disorder
- Toxin ingestion
- Hepatic encephalopathy

Results of blood tests abnormal (suspect metabolic cause)

- Hypoglycemia (rule out primary vs. insulinoma)
- Hypocalcemia (rule out primary vs. eclampsia)

Other

- Other neurologic signs

Cerebellar signs

- Congenital Neoplasia
- Idiopathic tremor
- Other

Multifocal neurologic signs

- Neoplasia
- Meningoencephalitis
- Other

Other neurologic signs

- Multifocal neurologic signs

Figure 2. Flow chart of treatment options for suspected tremorgenic mycotoxin ingestion. The choice of treatment depends on the severity of clinical signs. Active cooling should be instituted in animals that are severely pyrexic; the technique used should be appropriate to the status of the dog.
